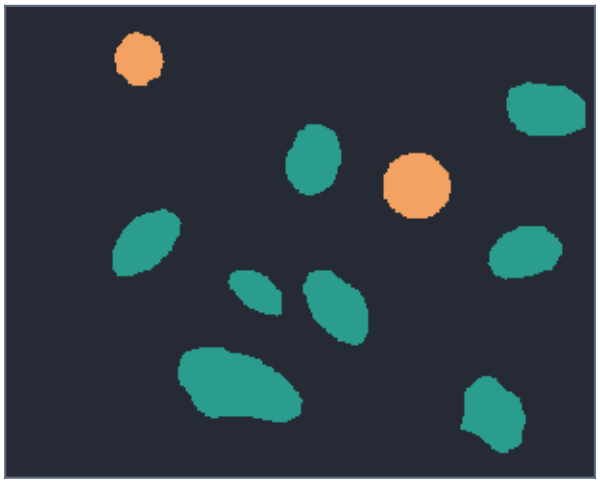
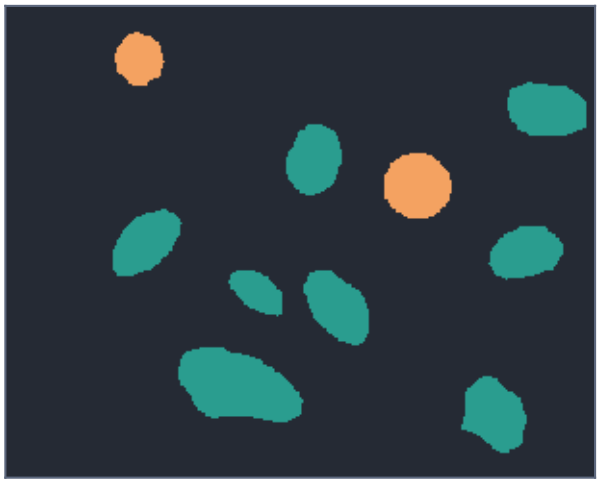
Mask-conversion fault audit

Raw mask read by scikit-image
values: 0, 128, 255



Reproduced unconditional scaling
values: 0, 1, 128

Corrected conditional handling
values: 0, 128, 255



Verified value mapping

Input uint8	Unconditional x255	Correct branch
0	0	0
128	128	128
255	1	255

uint8(255 x 255) = 1. The original value 255 therefore no longer passes the >200 mitotic threshold.

Dataset-wide verification

1. 345 raw masks audited
2. 261 masks contain value 255
3. 873,314 value-255 pixels
4. 345/345 instance masks match
5. 345/345 class masks match
6. Normalized and uint8 branches pass

Scope boundary: the fault mechanism and current outputs are verified. Use in a specific historical training run remains unresolved.
